

Wait Time / Fault Display System

DISPLAYS REAL-TIME STATUS MESSAGES TO MOTORISTS

The Wait Time / Fault Display System (WTFDS) provides drivers with a visual representation of the amount of time remaining before the next green indication. It is also configured to display a special message in the event of a signal error or fault, alerting drivers how to proceed, or to seek an alternate route.

The WTFDS's primary application is one-lane, bi-directional work zones utilizing Horizon Signal SQ3TS systems. Consisting of only a variable message sign, and a simple connection to the Horizon PTS, the system provides a convenient and easy way to communicate with motorists.

Wait Time/ Fault Display System

When the Horizon Portable Traffic Signal displays a red indication, the Changeable Message Sign (CMS) displays the remaining red time in minutes/ seconds. When the signal display changes to green, the CMS displays a "Slow Work Zone" message. On a yellow indication, the CMS displays a "# minutes (or seconds) wait time" message. All messages may be customized to meet project-specific requirements.

The WTFDS is available in two different sizes, and can also be upgraded to allow for remote access to the signal messages.

Small Message Board: 18" x 28"

Large Message Board: 24" x 60"

DISTRIBUTED BY

Provides visual confirmation of wait time for the motorist.

Compatible with all Horizon Signal Systems
