

SIGNAL UPGRADE

ARM System

Monitor signal operation from any internet connection.

Advanced Remote Monitoring for Your Horizon Portable Signals

The Advanced Remote Monitoring (ARM) System allows an authorized user to digitally manage and monitor a fleet of Horizon Portable Traffic Signals. Users can remotely access signal timing data and event logs from active signal systems outfitted with the ARM system, and also configure email and SMS text message alerts to be delivered based on signal operation.

Detailed history logs and status reports help keep you informed with up-to-the-minute information, so that you can better manage your Portable Traffic Signal equipment in the field.
